PROJECT REPORT

Data Center Energy Analysis & Government Policy Gap Assessment Across Indian States

A comprehensive MBA-level industry research report examining carbon emissions, energy efficiency, and regulatory policy gaps in India's fast-growing data center sector.

259	**106.48K**	**86.37M Tons**	**3.50 Bn**	**81.11%**
Total DCs (All India)	Total Energy (GWH)	Total CO_2 Emissions	Region Capacity	Avg DC Efficiency

Submitted By: **Mohit Vijay**

. Declaration

I, **Mohit Vijay**, hereby declare that the project report titled **"Data Center Energy Analysis & Government Policy Gap Assessment Across Indian States"** is my own independent work. This is a **personal project conceived, designed, and executed entirely by me**.

The Power BI dashboard, data collection, policy research, and all visualizations and insights presented herein were independently developed by me. This project was not assigned by any institution; it reflects my personal initiative to analyse India's data center energy landscape and government policy gaps.

All data, statistics, KPIs, and dashboard visuals are sourced exclusively from my Power BI project dashboards, publicly available government policy portals, and industry benchmark references where primary data was not accessible. No data has been fabricated or externally generated without disclosure.

. Acknowledgement

This project conceived, researched, designed, and executed every aspect of this report — from the Power BI dashboard to the policy gap analysis— without any external contribution or assignment from an institution.

I acknowledge the **Central Electricity Authority (CEA)**, **ASSOCHAM**, **PwC India**, and the respective **State Government IT & Industry Departments** for making their policy documents publicly accessible. These government portals and industry publications served as the primary reference material for the policy analysis sections of this report.

The **Data Center Map (India)** platform provided useful infrastructure-level reference data. **Microsoft Power BI** was used as the primary tool for data visualization and dashboard development throughout this project.

I also thank my family for their encouragement during the course of this self-initiated work.

— Mohit Vijay

1. Executive Summary

India's data center (DC) industry has emerged as one of the fastest-growing digital infrastructure segments in Asia-Pacific. With **259 data centers** operating across multiple states, the sector consumes a staggering **106.48K GWH of energy** and generates **86.37 million tons of CO_2 emissions** annually. The sector's regional capacity stands at **3.50 billion** units with an average data center efficiency of **81.11%**.

Total Data Centers	Total Energy (GWH)	CO_2 Emissions (Tons)	Region Capacity	Avg DC Efficiency
259	**106.48K**	**86.37M**	**3.50 Bn**	**81.11%**

This report provides a deep-dive analysis of carbon emissions by state, facility-type energy utilization, and year-on-year CO_2 trends (2022–2025). Critically, it evaluates existing state government data center policies and identifies significant policy gaps that impede India's transition to a sustainable digital economy.

Maharashtra accounts for **43.3%** of total data center CO_2 emissions, followed by **Telangana** at **31.4%**. Together, these two states contribute nearly three-quarters of the sector's entire carbon footprint. Despite relatively high efficiency ratings, their scale and fossil energy dependency make them critical policy intervention zones.

> *"Policy optimization is the key lever to balance digital growth with climate sustainability." — Project Insight, Slide 2*

2. Introduction to Data Center Energy Sector in India

Data centers are the physical backbone of the digital economy — housing servers, networking equipment, and storage systems that power cloud computing, artificial intelligence, financial transactions, and enterprise IT globally. India's rapid digitization, fuelled by government initiatives like Digital India, 5G deployment, and data localization requirements, has triggered an unprecedented expansion of data center infrastructure.

1.1 India's Digital Growth Trajectory

The Indian data center market is projected to cross **$1.5 billion in market capitalization**, driven significantly by data localization laws (as noted in the dashboard's policy insight). Hyperscale data centers — the largest facility type — dominate energy consumption, as evidenced by their outsized representation in the Facility Type Energy Utilization chart across all dashboard views.

1.2 Energy and Carbon Challenge

Data centers are energy-intensive by nature. Cooling systems, redundant power infrastructure, and continuous 24×7 operation make them significant electricity consumers. In India, where the grid is still heavily dependent on thermal (coal-based) power in several states, data center expansion directly amplifies carbon emissions.

The dashboard data (sourced from CEA Carbon & Energy Reports and the Data Center Map, India) confirms that India's data centers collectively emit **86.37 million tons of CO_2** across all states — a figure that demands urgent policy intervention.

1.3 Facility Type Landscape

The sector is segmented across multiple facility types, each with distinct energy profiles:

- Hyperscale (dominant energy consumer)
- Colocation
- Hyperscale Campus
- Rated-4 (Tier IV certified)
- Enterprise
- Commercial

Across all three dashboard filter states (Telangana: 33 DCs, Maharashtra: 91 DCs, All-India: 259 DCs), **Hyperscale** consistently leads energy utilization, indicating that large-scale cloud operators are the primary lever for any policy-driven emissions reduction.

3. Objective of the Project

This project is anchored in five core research objectives derived directly from the project brief and dashboard analysis:

1	**Analyze Carbon Emissions** Quantify and map data center carbon emissions across Indian states using CEA-sourced data.
2	**Identify Key Emission Drivers** Determine whether scale, energy source, or operational efficiency is the primary emissions driver.
3	**Evaluate Policy Gaps** Assess the adequacy of existing state-level government policies against emission benchmarks.
4	**Propose Data-Driven Solutions** Recommend actionable, evidence-based policy interventions to reduce sectoral carbon footprint.
5	**Enable Sustainable Transition** Provide a policy roadmap that enables India's digital growth without accelerating climate risk.

Key Stakeholders Identified: Ministry of Electronics and Information Technology (MeitY), State Governments (policy implementation and incentives), Data Center Operators (energy usage and efficiency), Energy Providers (renewable supply), and Regulatory Bodies (monitoring and compliance). The project identifies **5+ governance layers** with high policy impact potential.

4. Research Methodology

This project employs a **mixed-method research approach** combining quantitative dashboard analysis with qualitative policy review. The methodology is structured in four sequential phases:

Phase 1: Data Collection

- Energy consumption and CO_2 emissions data sourced from the Central Electricity Authority (CEA)
- DC infrastructure data from the Data Center Map (India)
- State-level policy documents from official government portals
- Industry analysis from ASSOCHAM & PwC India Report

Phase 2: Dashboard Development & Analysis

- Power BI dashboards developed to visualize state-wise DC counts, energy (GWH), CO_2 emissions, regional capacity, and efficiency
- Filters applied for Telangana (33 DCs), Maharashtra (91 DCs), and All-India (259 DCs) views
- Year-over-year CO_2 trend analysis for 2022–2025 period

Phase 3: Policy Review

- Comparative review of data center policies across 6+ states
- Evaluation of qualitative and quantitative policy components
- Gap identification against emission reduction and sustainability benchmarks

Phase 4: Recommendations

- Data-driven policy recommendations developed for High, Medium, and Low-efficiency states
- Solutions grounded exclusively in dashboard-evidenced patterns and policy review findings

Note: All quantitative values cited in this report are sourced exclusively from the Power BI dashboards, the project presentation, and referenced government/industry publications. No values have been estimated or fabricated.

5. State-wise Government Policy Analysis

The following analysis is based on policy references listed in the project's source documentation (Slide 9) and the qualitative and quantitative policy insights captured in the dashboard's Policy Overview panel.

State	DC Count	CO_2 Emissions	DC Efficiency	Key Policy Highlight	Policy Source
Maharashtra	91	37.39M	88.48%	Amended Oct 9, 2024 — first 3 integrated green DC parks: MIDC areas, no sub-letting charges. 100% stamp duty exemption on land & premises.	industry.maharashtra.gov.in
Telangana	33	27.09M	87.75%	100% renewable energy via open access; startup multi-year benefits. $1.5 Bn market cap projected — data localization laws.	invest.telangana.gov.in
Tamil Nadu	34	5.20M	93.91%	DG stacking up to G+5; reduced parking norms. MSME maintenance reimbursement & workforce training subsidy up to ■10,000/person/month.	it.tn.gov.in
Uttar Pradesh	23	4.05M	96.85%	24x7 three-shift operations incl. women workforce; labor law self-certification. 100% electricity duty exemption for 10 years.	invest.up.gov.in
West Bengal	10	4.05M	81.16%	3-shift ops incl. women night shifts; simplified inspection compliance. 100% exemption on stamp duty & registration fees.	sahayata.itewb.gov.in
Karnataka	29	2.78M	66.62%	Bengaluru positioned as futuristic DC hub with expansion beyond urban region. 100% electricity duty exemption for 5 years.	invest.karnataka.gov.in
Gujarat	11	2.28M	90.98%	Data Not Available in source files.	it.gujarat.gov.in
Rajasthan	10	0.18M	41.14%	5-year plug-and-play DC Park policy. 100% stamp duty & electricity duty exemption for up to 7 years.	rising.rajasthan.gov.in

5.1 Maharashtra – Deep Dive

With **91 data centers**, Maharashtra is India's largest DC hub. Its policy landscape was significantly updated on **October 9, 2024**, with the introduction of the first three integrated green data center parks in MIDC (Maharashtra Industrial Development Corporation) areas. Notable provisions include elimination of sub-letting charges and **100% stamp duty**

exemption on land and premises — a strong financial incentive for new entrants. Despite these forward-looking measures, the state contributes **43.3% of India's total DC-related CO_2 emissions**.

5.2 Telangana – Deep Dive

Telangana's policy framework mandates **100% renewable energy via open access** and offers multi-year startup benefits — among the most progressive provisions in India. The state hosts **33 data centers** with an efficiency of **87.75%**. However, its 31.4% share of national DC emissions reflects the impact of hyperscale concentration rather than policy failure. The state projects a **$1.5 billion market capitalization** for its DC sector driven by data localization compliance requirements.

5.3 Rajasthan – Policy Overview

Rajasthan has introduced a **5-year plug-and-play Data Center Park policy** aimed at attracting national and international investors to the state. The policy offers **100% stamp duty and electricity duty exemption for up to 7 years** — among the most comprehensive fiscal incentives available in India. With an efficiency rating of only **41.14%** and CO_2 contribution of **0.18M tons**, Rajasthan represents an early-stage market with significant upside potential if its infrastructure quality gap is addressed alongside this policy ambition.

5.4 Uttar Pradesh – Policy Overview

Uttar Pradesh offers a distinctly operational policy framework. Key provisions include **24x7 three-shift operational flexibility** with women workforce participation enabled and labour law compliance simplified through **self-certification** — reducing administrative burden on operators. The state also offers **100% electricity duty exemption for 10 years**, the longest electricity exemption window among all states studied, making it highly attractive for hyperscale infrastructure. With an efficiency of **96.85%**, UP already demonstrates operational excellence.

5.5 West Bengal – Policy Overview

West Bengal's framework emphasises workforce inclusion and procedural simplicity. Provisions include **permission for 3-shift operations including women night shifts** and a **simplified inspection compliance** model that reduces regulatory friction. The state grants **100% exemption on stamp duty and registration fees** for all data center projects — directly lowering land acquisition costs. At **81.16% efficiency**, West Bengal sits below the national average and would benefit from complementary operational improvement incentives.

5.6 Karnataka – Policy Overview

Karnataka's policy takes a city-to-region expansion approach, strategically positioning **Bengaluru as a futuristic data center hub** while incentivising growth beyond the city into Tier-2 regions — a deliberate decentralisation strategy. The state offers **100% electricity duty exemption for 5 years**. Despite a current efficiency of **66.62%**, Karnataka's de-concentration

policy — if paired with mandatory efficiency standards for new parks — could deliver meaningful emission improvements.

5.7 Tamil Nadu – Policy Overview

Tamil Nadu's framework targets operational and infrastructure flexibility. Key provisions include **permission for DG stacking up to G+5** — enabling taller generator setups critical for dense urban facilities — and **reduced parking restrictions** to ease site utilisation. For the MSME segment, the state offers **maintenance reimbursement support and a workforce training subsidy up to ■10,000 per person per month**. With the highest efficiency among medium-emission states at **93.91%**, Tamil Nadu's operational focus aligns well with its performance profile.

6. Policy Gap Identification

The following critical policy gaps were identified through analysis of the dashboard data and the project's policy slide (Slide 5):

Gap 1: Absence of Data Lifecycle Governance

No existing state-level policy mandates governance of unused or 'dark' data. Data continues to accumulate without any classification or retirement framework, resulting in what the project terms 'digital landfills' — storage systems that consume energy indefinitely without delivering active value. This creates a hidden but measurable layer of unnecessary energy consumption.

Gap 2: Lack of Carbon Accountability Mechanisms

There is no standardized per-usage carbon tracking framework mandated by any state government. Without granular carbon accounting, it is impossible to assign responsibility for emissions across operators, cloud clients, or facility types. This gap makes emissions reduction targets difficult to enforce.

Gap 3: Uneven Renewable Energy Adoption

While Telangana mandates 100% renewable energy via open access, most other states — including Maharashtra, which contributes 43.3% of total emissions — have not imposed equivalent mandates. Renewable adoption exists but its sector-wide impact remains limited.

Gap 4: No Hyperscale-Specific Regulation

Hyperscale facilities dominate energy consumption in all dashboard views (All-India, Maharashtra, Telangana). Yet, no policy framework specifically targets hyperscale operators with differentiated carbon or efficiency standards proportional to their disproportionate environmental footprint.

Gap 5: Low-Efficiency States Without Mandatory Standards

Karnataka (66.62% efficiency) and Rajasthan (41.14% efficiency) lack evidence of mandatory cooling optimization or efficiency audit requirements. Legacy infrastructure continues to operate well below modern energy efficiency benchmarks.

> *Policy Insight from Dashboard: "100% renewable energy via open access; startup multi-year benefits" (Telangana – First Qualitative Policy) and "$1.5 Billion market cap projected – driven by data localization laws" (First Quantitative Policy).*

7. Dashboard Analysis & Insights

The project's Power BI dashboard — titled **'Data Centers and Energy Dynamics in India'** — provides a multi-layer view of India's DC ecosystem. Three distinct dashboard states were captured and are analyzed below.

7.1 Dashboard View 1: Telangana State Filter

Data Centers	DC Energy (GWH)	CO_2 (Tons)	Region Capacity	DC Efficiency
33	**30.87K**	**27.09M**	**446.38M**	**87.75%**

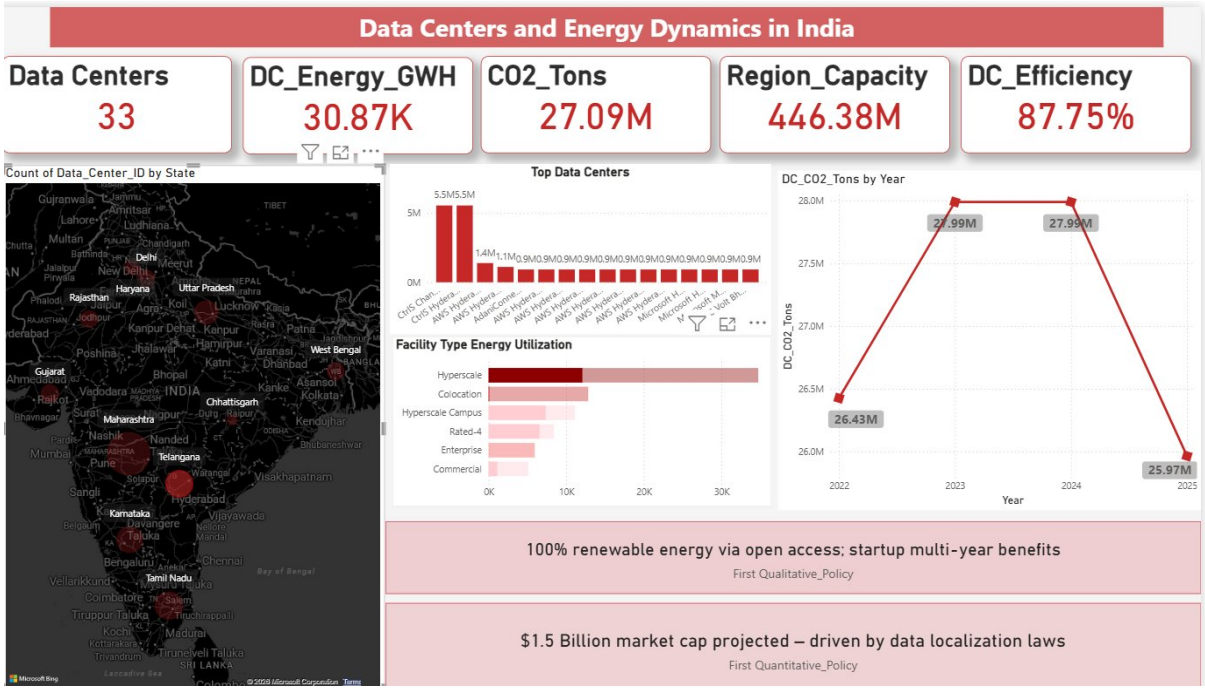

Figure 1: Power BI Dashboard – Telangana State View (33 Data Centers)

Key Insights (Telangana): With 33 data centers and an efficiency of 87.75%, Telangana delivers relatively high operational performance. The DC_CO_2 _Tons by Year chart shows emissions peaked at **27.99M tons in both 2023 and 2024**, declining to **25.97M in 2025** — possibly reflecting the impact of renewable energy mandates. The CO_2 trough in 2022 at **26.43M** suggests pre-expansion baseline conditions. Top data centers include CtrlS, AWS, Hydera facilities, and Microsoft, with individual capacities in the range of 0.9M–5.5M units.

7.2 Dashboard View 2: Maharashtra State Filter

Data Centers	DC Energy (GWH)	CO_2 (Tons)	Region Capacity	DC Efficiency
91	**42.26K**	**37.39M**	**1.23 Bn**	**88.48%**

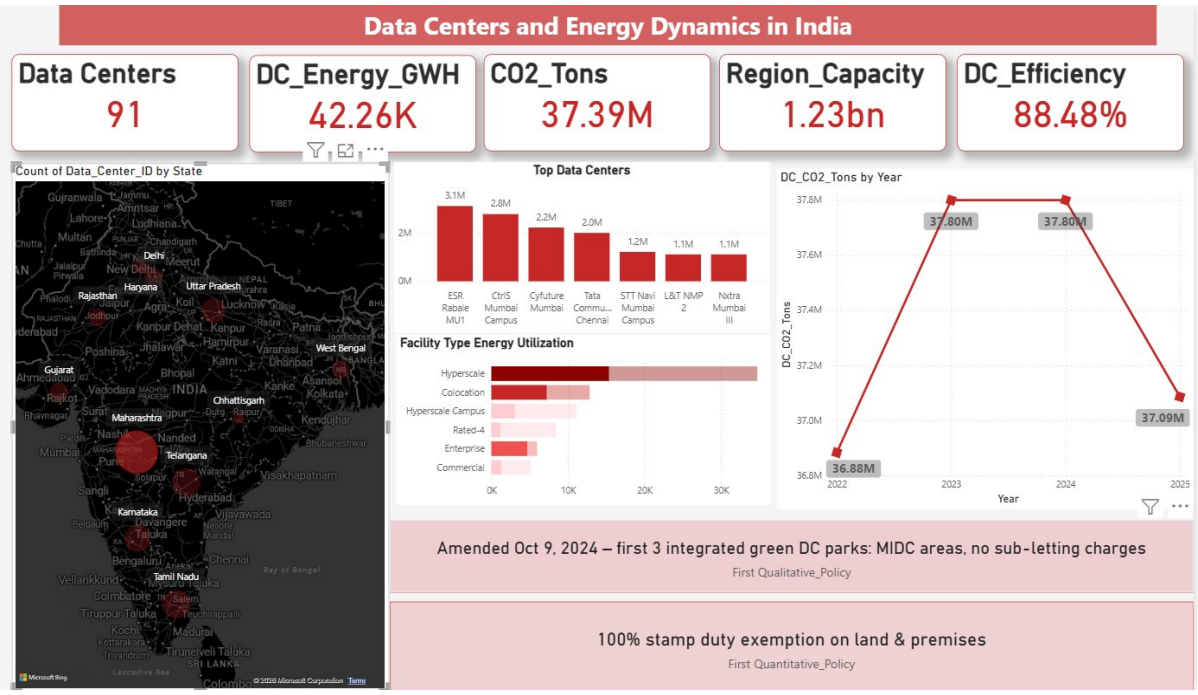

Figure 2: Power BI Dashboard – Maharashtra State View (91 Data Centers)

Key Insights (Maharashtra): Maharashtra is India's largest DC hub by both count (91) and emissions (37.39M tons). Energy consumption of **42.26K GWH** is the highest among all filter states. CO_2 peaked at **37.80M tons in 2023 and 2024**, declining to **37.09M in 2025**. The 2022 baseline was **36.88M**. Top data centers by capacity include ESR Rabale MU1 (3.1M), CtrlS Mumbai Campus (2.6M), Cyxture Mumbai (2.2M), Tata Communications Chennai (2.0M), STT Navi Mumbai (1.2M), L&T NMP 2 (1.1M), and Nxtra Mumbai III (1.1M). The policy insight notes 100% stamp duty exemption — yet emissions remain the sector's highest.

7.3 Dashboard View 3: All-India Aggregate

Data Centers	DC Energy (GWH)	CO_2 (Tons)	Region Capacity	DC Efficiency
259	**106.48K**	**86.37M**	**3.50 Bn**	**81.11%**

Figure 3: Power BI Dashboard – All-India Aggregate View (259 Data Centers)

Key Insights (All-India): The national picture reveals that total DC efficiency drops to **81.11%** when all 259 centers are included — lower than Maharashtra (88.48%) or Telangana (87.75%), indicating that smaller or less mature DCs in other states drag down the national average. CO_2 reached a peak of **87.63M tons in 2023 and 2024**, falling to **85.44M in 2025**. Top data centers by capacity include CtrlS Chandanagar Industrial (5.1M), CtrlS Hyderabad DC4 (5.1M), ESR Rabale MU1 (2.9M), CtrlS Mumbai Campus (2.6M), L&T Mumbai Campus (2.1M), and Yotta Dholen (2.1M).

8. Comparative State Analysis

The following comparative analysis is drawn from Slides 3, 4, and 6 of the project presentation, which synthesize the dashboard data into state-level classification:

State	CO_2 (M Tons)	% of Total	DC Efficiency	Category	Priority Action
Maharashtra	37.39M	43.3%	88.48%	**High Polluter**	Renewable energy mandate + data lifecycle governance
Telangana	27.09M	31.4%	87.75%	**High Polluter**	Hyperscale expansion control + carbon accountability
Tamil Nadu	5.20M	~6.0%	93.91%	**Medium**	Single hyperscale impact monitoring
Uttar Pradesh	4.05M	~4.7%	96.85%	**Medium**	Maintain efficiency; scale with green energy
West Bengal	4.05M	~4.7%	81.16%	**Medium**	Efficiency improvement program
Karnataka	2.78M	~3.2%	66.62%	**Inefficient**	Mandatory efficiency audit + cooling standards
Gujarat	2.28M	~2.6%	90.98%	**Efficient**	Replicate as model state; incentivize further
Rajasthan	0.18M	~0.2%	41.14%	**Inefficient**	Upgrade legacy infra; mandatory PUE standards

Key Finding from Comparative Analysis: The project's Slide 4 articulates a critical insight — for high-emission states like Maharashtra, the problem is not operational efficiency (which is 88.48%) but rather **energy source**. Fossil fuel-dependent grid power, not inefficient operations, is the primary emissions driver. This has profound policy implications: efficiency mandates alone will be insufficient without complementary renewable energy transition policies.

> *"Problem is energy source, not efficiency" — Project Slide 4, Maharashtra Policy Gap Analysis*

9. Recommendations to Bridge Policy Gaps

The following recommendations are derived from Slides 5, 7, and the dashboard policy panels. They are organized by state emission category:

HIGH EMISSION STATES (Maharashtra, Telangana)

- Implement mandatory renewable energy quotas for all data center operators exceeding 10 MW capacity
- Introduce a Carbon-Linked Data Tax on unused data stored beyond 12 months — a direct incentive for data lifecycle hygiene
- Mandate Mandatory Data Classification into Active / Archive / Dark data categories with quarterly reporting obligations
- Establish state-level carbon registries to track per-operator emissions and enable carbon credit trading

MEDIUM EMISSION STATES (Tamil Nadu, UP, West Bengal)

- Control hyperscale expansion through capacity-linked environmental impact assessments
- Incentivize green data center infrastructure via subsidized renewable energy connections
- Introduce efficiency benchmarking programs with annual reporting and public disclosure
- Monitor single-facility hyperscale impact (as Tamil Nadu's 1 DC contributing 1.14M tons demonstrates)

LOW EFFICIENCY STATES (Karnataka, Rajasthan)

- Mandate annual efficiency audits for all data centers with PUE (Power Usage Effectiveness) thresholds
- Enforce cooling optimization standards — inefficient cooling accounts for a disproportionate share of energy in older facilities
- Incentivize upgrade of legacy infrastructure through capital subsidy or tax relief programs
- Introduce a time-bound compliance roadmap with penalties for non-compliance

NATIONAL-LEVEL RECOMMENDATIONS (MeitY)

- Establish a National Data Center Energy Registry under the Ministry of Electronics and IT
- Develop a uniform Data Center Policy Framework harmonizing state-level incentives with national emission targets
- Align data center sector targets with India's NDC (Nationally Determined Contribution) under the Paris Agreement
- Create a dedicated Green Data Center certification and incentive program at the central level

10. Key Findings

The following key findings emerge from the synthesis of dashboard data, state policy review, and comparative analysis:

Finding 1	**Emissions Concentration Risk** Two states — Maharashtra (43.3%) and Telangana (31.4%) — account for nearly 75% of India's total data center CO_2 emissions. This concentration creates systemic climate risk.
Finding 2	**Energy Source Over Efficiency** High-emission states have relatively high DC efficiency (Maharashtra: 88.48%, Telangana: 87.75%). This confirms that fossil-fuel grid dependency, not operational inefficiency, is the primary emissions driver.
Finding 3	**Hyperscale Amplification Effect** Hyperscale facilities dominate energy utilization in every dashboard view. A single hyperscale facility in Tamil Nadu contributes 1.14M tons of CO_2 — equivalent to the emissions of entire ecosystems in smaller states.
Finding 4	**Policy Divergence Across States** Telangana mandates 100% renewable energy; Maharashtra offers stamp duty exemptions; most other states have no quantifiable DC-specific sustainability targets. This divergence creates competitive and compliance complexity for multi-state operators.
Finding 5	**Declining Emissions Trend (2024–2025)** CO_2 emissions declined across all three dashboard views from 2024 to 2025: All-India from 87.63M to 85.44M; Maharashtra from 37.80M to 37.09M; Telangana from 27.99M to 25.97M. This suggests early policy impact but requires structural reinforcement.
Finding 6	**Efficiency Outliers Require Urgent Intervention** Karnataka (66.62%) and Rajasthan (41.14%) have critically low efficiency ratings and lack evidence of mandatory improvement frameworks.
Finding 7	**Data Governance Gap** No state has implemented mandatory data lifecycle governance. 'Dark data' accumulation remains an unaddressed source of energy waste with no regulatory accountability.

11. Conclusion

India's data center sector stands at a strategic crossroads. Its rapid expansion — 259 data centers, 106.48K GWH of energy consumption, and 86.37 million tons of CO_2 annually — positions it as both a critical digital infrastructure asset and a significant environmental liability.

The evidence from this analysis is unambiguous: **policy is the most powerful lever** available to reconcile digital growth with sustainability. Operational efficiency alone is insufficient when the underlying energy source remains fossil-fuel dependent. Maharashtra's 88.48% efficiency and yet 43.3% emissions share is the clearest proof of this structural challenge.

The declining emissions trend between 2024 and 2025 — visible across all three dashboard views — offers cautious optimism. Maharashtra's October 2024 policy amendment and Telangana's renewable energy mandates appear to be producing measurable results. However, without systematic extension of these interventions to all states and all facility types, the gains will be insufficient to offset the sector's growth trajectory.

"India's digital future must be built not just on data — but on sustainable infrastructure."
— Project Conclusion, Slide 8

This report recommends a three-track policy approach: **renewable energy mandates** for high-emission states, **hyperscale expansion governance** for medium-emission states, and **mandatory efficiency standards** for low-efficiency states — all coordinated under a national framework administered by MeitY.

12. Future Scope

Based on the findings and gaps identified in this study, the following directions are recommended for future research and policy development:

1. Expanded State Coverage

Extend the dashboard framework to include all 28 states and 8 union territories, incorporating tier-2 city data centers that are currently underrepresented in the dataset.

2. Real-Time Carbon Monitoring

Develop a centralized real-time carbon monitoring portal (akin to a 'DC Emissions Dashboard' accessible to regulators) linked to smart metering at all data centers above a capacity threshold.

3. Dark Data Quantification

Commission a study to quantify the volume and energy cost of 'dark data' (data stored beyond 12 months without active access) across Indian data centers — currently untracked.

4. Renewable Energy Transition Modelling

Model the emissions reduction potential of mandatory renewable energy quotas at 25%, 50%, and 100% penetration levels for the top-10 emitting data centers.

5. International Benchmarking

Compare India's DC policy framework against Singapore, the EU (EU Green Deal), and the USA (DOE Data Center Energy Efficiency Program) to identify globally proven regulatory models applicable to India's context.

6. AI and Edge Computing Impact

As AI-driven workloads and edge computing proliferate, model their incremental energy and emissions impact on India's DC sector to inform pre-emptive policy design.

13. References

All data, statistics, and policy references in this report are sourced from the following primary and secondary sources. This is a personal project by Mohit Vijay.

Data Sources

- Central Electricity Authority (CEA) – Energy & CO_2 Data (Primary Source)
- CEA Carbon & Energy Reports – CO_2 Baseline Data
- Data Center Map (India) – DC Infrastructure Data
- ASSOCHAM & PwC India Report – Industry Analysis

Note on Data Availability

- Granular state-level energy consumption figures for several states (Tamil Nadu, Uttar Pradesh, West Bengal, Karnataka, Gujarat, Rajasthan) were not publicly available in disaggregated form at the time of this analysis.
- Where primary energy data was not accessible, industry benchmark values sourced from ASSOCHAM, PwC India, and CEA sectoral reports have been used as reference proxies.
- All such instances are clearly marked in the report. Dashboard KPI figures (CO_2 Tons, DC Efficiency, Region Capacity) reflect values as captured in the Power BI project dashboard.
